Executive Summary

OSG (OneX Smart Gold) is a fixed-supply ERC-20 token on Polygon. Apart from a one-time team allocation minted at deployment, new supply is created only by a published, capped emission schedule enforced by verified contracts.

- ▶ **Fixed supply.** The maximum supply is 23,000,000 OSG, hard-coded in the token contract. As of 5 October 2026, 648,326 OSG (about 2.8%) had been minted: 460,000 as the team allocation at deployment and 188,326 through emission.
- ▶ **Capped, scheduled emission.** A fixed daily release is divided between protocol activities and halves approximately every three years. Minting is further limited to 500 OSG per hour and 9,000 OSG per day by the token contract itself.
- ▶ **No sale of any kind.** No presale, ICO, private round or public sale. The only non-emission supply is the 2% team allocation, disclosed in Section 08.
- ▶ **Participation, not promises.** Holders may lock OSG or OSG/WPOL liquidity for a fixed term. Reward rates are ceilings that fall as participation rises; nothing is fixed or guaranteed.
- ▶ **Utility.** A peer-to-peer exchange, wallet-to-wallet messenger, multilingual assistant and a public scanner (OSGScan) are part of the protocol.
- ▶ **Verifiable.** Every contract is open-source and verified on Polygonscan. Every figure in this document can be read from the chain, and where this document and the chain differ, the chain governs.

Not backed by gold. “Smart Gold” describes a design goal — scarcity through a fixed supply. OSG is not backed by, linked to, or redeemable for physical gold or any other commodity, currency or asset.

Token at a Glance

The essential facts in one place. Each line can be checked on Polygonscan against the token contract.

ITEM	DETAIL
Name / ticker	OneX Smart Gold · OSG
Network	Polygon PoS mainnet (chain ID 137)
Contract	0xba05176748347944CC26900c821AbFeBeBC57415
Standard	ERC-20 with Permit (EIP-2612) and Votes; 18 decimals
Maximum supply	23,000,000 OSG (hard-coded constant)
Minted to date	648,326 OSG · 5 Oct 2026
Who can mint	Only the Reward Pool contract today. Governance can add a minter only after a 72-hour on-chain delay.
Team allocation	460,000 OSG (2% of maximum supply), minted once at deployment; no on-chain vesting
Mint ceilings	500 OSG per hour and 9,000 OSG per day, enforced in the token
Transfer tax / burn	No tax (0% buy, 0% sell). Any holder may burn their own OSG.
Emergency pause	The owner key or governance can pause transfers; only governance can unpause (Section 14)
Primary market	QuickSwap V2, OSG/WPOL pair
Pair contract	0xA15214B09a9b3E1c821B94fB97d6d3BcA8201Cd2
Launch	No presale, ICO, private or public sale

Vision & Design Principles

A digital asset should be judged by what its contracts enforce, not by what its marketing asserts.

Scarcity by construction

A hard cap of 23,000,000 OSG, enforced by the token contract rather than by policy.

Predictable issuance

A published daily schedule with periodic halving, so future supply is knowable in advance.

Verifiable over persuasive

Every claim in this document maps to a contract anyone can read on Polygonscan.

Delayed control

Sensitive changes pass through on-chain delays, so they can be seen before they take effect.

Separation of duties

Value, accounting and presentation live in separate contracts, so a view can be replaced without touching balances.

Open participation

No allowlist and no gatekeeper. Anyone with a Polygon wallet can take part.

The Problem

The failures below are common in reward-bearing token systems. Each one informed a specific design decision in OSG.

- ▶ **Unbounded issuance.** Many reward tokens mint on demand. Supply expands to meet payouts, and holders absorb the dilution.
- ▶ **Opaque accounting.** Reward figures are produced off-chain and shown in an interface that cannot be independently checked.
- ▶ **Unilateral control.** Where an owner key can change rates instantly and silently, every published parameter is provisional.
- ▶ **Rates presented as returns.** Variable, participation-dependent reward rates are marketed as fixed yields, which they are not.
- ▶ **Documentation that drifts.** Published papers fall behind deployed code, leaving readers with figures that no longer match the chain.

This applies to OSG too. Earlier versions of this paper were not kept current as contracts were replaced. From version 4.0 the paper is written against the deployed contracts in Section 17, its source is version-controlled, and every revision is listed in Section 19.

The OSG Approach

Each element answers one of the problems in Section 04 and is implemented in a contract listed in Section 17.

Hard-capped supply

23,000,000 OSG maximum, plus hourly and daily mint ceilings in the token contract.

Scheduled emission

A fixed daily release divided between protocol activities, halving roughly every three years.

Contract-held funds

Staked OSG and locked liquidity are held by verified contracts, not by a company wallet.

Visible change

Governance actions are queued with an enforced delay; rate ceilings are bounded in code.

On-chain accounting

Balances, accruals and payouts are computed on-chain and readable by anyone.

Utility beyond yield

Messaging, a peer-to-peer exchange and a public scanner are part of the protocol, not add-ons.

Ecosystem Architecture

Each deployed contract has a single responsibility. Full addresses appear in Section 17.

CONTRACT	ROLE	ADDRESS
OSG Token	ERC-20, fixed cap, hourly mint ceiling	0xba05...7415
Reward Pool	Daily emission and distribution	0xDc4f...2855
Reward Storage	Holds undistributed rewards	0xa0b2...BEcB
Term Staking v2	180-day OSG positions (closed to new entries)	0xb3DE...7cCc
LP Mining · 365 days	Locked OSG/WPOL liquidity	0x1F04...d0fC
LP Mining · 180 / 540 days	Locked OSG/WPOL liquidity, two terms	0x333a...17C8
Community Programme v5	Community programme accounting	0x5838...c52A
Community Bonus	One-time, Treasury-funded bonus	0x7Ee9...7C92
Treasury	Programme funding	0x4669...DF50
Legacy Staking	Original staking contract (1% share)	0x048E...A886
P2P Exchange	On-chain order book	0x269E...E1bb
Messenger / Media	End-to-end encrypted messaging	0x29c6...FA5c
TimelockDAO	Delayed governance actions	0xE2E8...0D4c

Replaceable views, permanent ledgers. Accounting contracts hold balances and rules; read-only lens contracts hold none, so a view can be replaced without migrating a single balance.

Tokenomics & Emission

Supply is capped. Everything below describes how the remaining supply enters circulation — and nothing else can.

DAILY EMISSION BUCKET	SHARE
Mining — Term Staking and LP Mining	68%
Community programme	31%
Legacy staking contract	1%
WITHIN THE 68% MINING BUCKET (5 OCT 2026)	SHARE
LP Mining · 180 / 540 days	48.53%
LP Mining · 365 days	35.29%
Term Staking	16.18%

- ▶ **Daily release.** 5,881 OSG per day in the first period, halving every three years (four halvings). The next halving is scheduled for June 2029.
- ▶ **Finite schedule.** Emission runs for 15 years from launch and then stops. The schedule can create at most about 12.48 million OSG; with the team allocation, about 12.94 million in total.
- ▶ **The rest of the cap.** Supply above that, up to 23,000,000, could only be created by a new minter added through governance with a 72-hour on-chain delay. No such minter exists today.
- ▶ **Adjustable shares.** The split is a governance parameter and has been changed before. The Reward Pool and each mining contract are the authoritative source for live values.

Supply & Distribution

Where minted OSG came from and where it sat on 5 October 2026 (read from Polygonscan), and how circulating supply is defined.

HOLDER	OSG	SHARE OF MINTED
Term Staking contract (participants' staked OSG)	294,061	45.4%
QuickSwap OSG/WPOL pool (OSG side)	83,151	12.8%
Treasury and Reward Storage (combined)	< 8,000	< 1.3%
All other addresses (690+ holders)	263,000–271,000	40.6–41.8%
Total minted	648,326	100%

- **Origin of minted supply.** 460,000 OSG (71%) is the team allocation minted at deployment; 188,326 OSG (29%) was created by the emission schedule.
- **Circulating supply.** Total minted, minus OSG held by the Treasury and Reward Storage contracts. Staked and liquidity-locked OSG is counted, because it belongs to participants. The figure also includes OSG held by the team, which is not separated out.
- **Team allocation.** 460,000 OSG (2% of maximum supply) was minted to the team at deployment. It is not subject to any on-chain vesting or lock. Part has been used for development and operations; the remainder is held in team wallets, some of it staked or provided as liquidity.
- **Concentration.** As with most early-stage tokens, a small number of wallets hold a meaningful share. The two largest non-contract holders together held about 20% of minted supply on the snapshot date. The live holder list is public on Polygonscan.

No sale ever took place. There was no presale, ICO, private round or public sale. No investor allocations, unlock schedules or market-maker loans exist.

Term Staking

Term Staking let a holder lock OSG and receive a share of the mining emission. The DApp no longer opens new positions; existing positions continue unchanged.

- ▶ **Lock.** Principal is withdrawable once both conditions are met: 180 days have passed since the position was opened, and the two-times ceiling has been reached.
- ▶ **Two-times ceiling.** A position stops accruing once its total rewards reach twice the amount staked. How much is fixed at deposit; how long it takes is not, and is never promised.
- ▶ **Floating rate.** The ceiling is bounded in code between 0.1% and 2.0% per day; the rate actually paid may be lower. When the daily budget cannot cover every position at the ceiling, every position's rate falls together, in proportion.
- ▶ **Early exit.** At any earlier time, a forfeit exit returns 100% of principal at any time and gives up rewards accrued but not yet delivered.
- ▶ **If emission ends.** Any position still open when emission ends becomes withdrawable, principal intact.
- ▶ **Closed to new positions.** New entries are no longer offered in the DApp, and the contract will stop accepting them once a deposit deadline is set on-chain.

What this is not. Term Staking is not a deposit, a savings product or an instrument bearing interest. It is participation in a capped emission schedule, and the amount received depends on factors outside any participant's control.

LP Mining

LP Mining shares emission with participants who lock OSG/WPOL liquidity, making the market deeper for every holder.

180 days

Shortest term. Rate ceiling per unit of value is half that of the 540-day term.

365 days

The original LP Mining contract. Its own budget share and rate ceiling.

540 days

Longest term. Rate ceiling per unit of value is twice that of the 180-day term.

- ▶ **How it works.** Supply OSG and POL to the QuickSwap V2 OSG/WPOL pair, receive LP tokens, and lock them in the chosen contract. Each LP token is valued in OSG at an owner-set weight, fixed into the position at deposit. The weight is deliberately not read from pool reserves, which can be manipulated within a single transaction.
- ▶ **Rates are ceilings.** If the daily budget cannot cover every position at its ceiling, rates fall together and in proportion; on the 180/540-day contract the 540-day term always stays exactly twice the 180-day term.
- ▶ **Announced changes.** On the 180/540-day contract a rate change must be proposed on-chain and cannot apply for 48 hours. On the older contracts the owner can change the ceiling immediately; the team commits to giving the same 48-hour public notice.
- ▶ **Receipt.** Positions on the 180/540-day contract are shown in the wallet as a non-transferable receipt token (lpOSG).
- ▶ **No early exit.** Liquidity stays locked until the chosen term ends. The owner can end the lock early for all positions at once — a one-way action that can never be reversed.

Impermanent loss is real and is not compensated. Liquidity in a two-token pair changes in value with the ratio between them. A participant may withdraw fewer OSG, or less total value, than deposited — regardless of rewards.

Community Programme

A share of emission supports community growth and outreach. It is a promotional programme, not a core function of the token.

- ▶ **Funded from emission.** The programme draws on its own 31% emission bucket and, for a one-time community bonus, on the Treasury. It is never deducted from another participant's balance or principal.
- ▶ **Rules live on-chain.** Eligibility and amounts are enforced by verified contracts and shown in the DApp. They are deliberately not reproduced here, because they are governance parameters and this document is not their authoritative source.
- ▶ **Not permanent.** Governance may reduce, restructure or end the programme in future, and redirect its share of emission to other protocol activities. Participants should not rely on its continuation.
- ▶ **Not an income scheme.** Nothing in the programme promises any amount. Rewards depend on the emission schedule and on overall participation.

Why it exists. Early networks need participants. The programme is a time-limited way to reward people who help the community grow, paid from a fixed, published budget rather than from new participants' funds.

P2P Exchange

A peer-to-peer venue built into the protocol, letting holders trade directly with each other on-chain.

- ▶ **On-chain order book.** Orders are placed, matched and settled by the exchange contract. There is no off-chain matching engine and no custodian.
- ▶ **Automatic matching.** An incoming order fills against the best available price on the opposite side, without waiting for a counterparty to act.
- ▶ **Fee.** Currently 0.5%, charged on execution and applied identically to every participant. The owner can adjust it up to a contract maximum of 2%.
- ▶ **Self-custody throughout.** Funds move wallet to wallet through the contract. At no point does any operator hold participant funds.
- ▶ **Expired orders.** An unfilled order can be cancelled and the committed funds returned. Expiry does not release funds automatically; a cancellation must be submitted.

Messenger, Assistant & OSGScan

Features that make the protocol usable rather than merely holdable.

Wallet-to-wallet messaging

End-to-end encrypted messages to any wallet address. No phone number, email or registration. References on Polygon, encrypted media on IPFS.

Multilingual assistant

Answers questions about the protocol in the member's own language, reads the connected wallet's live position, and makes greeting pictures.

OSGScan

A public scanner for OSG activity: addresses, transactions, positions and contract health, readable without a wallet.

No credential requests, ever

No part of the protocol will ask for a seed phrase or private key. Any message that does is fraudulent.

Content is encrypted; metadata is public. Message content is encrypted end to end, but which wallets exchanged messages, and when, is visible on a public blockchain. Treat messaging as pseudonymous, not anonymous.

Governance & Security

Control over the protocol is limited by contract design and by on-chain delays. Its remaining weaknesses are stated plainly.

- ▶ **Timelock.** Governance actions are queued in the TimelockDAO and cannot execute for 24 hours; an action not executed within 30 days expires.
- ▶ **Token safeguards.** Adding a minter takes 72 hours on-chain. Minting is capped at 500 OSG per hour, 9,000 per day and 23,000,000 in total. The owner key can remove a minter immediately but cannot add one.
- ▶ **Bounded parameters.** Rate ceilings, budget shares and capacities can only move within limits written into each contract. Newer contracts use two-step ownership transfer and a pause-only guardian role. On older contracts some settings, such as reward ceilings and the P2P fee, can be changed by the owner immediately.
- ▶ **Emergency pause.** The owner key can pause OSG transfers immediately, and governance can do so through the timelock; only governance can unpause. This protects holders during an incident, but it is also a power holders should know exists.
- ▶ **Verified source.** Every contract in Section 17 is open-source and verified on Polygonscan.

Known limitations. The TimelockDAO has a single administrator and no voting; it provides delay, not decentralisation. Several administrative functions are held by an owner key (0xF8ac...BB83) pending transfer to the timelock. No third-party audit report has been published; verification on Polygonscan is not equivalent to an audit.

Risk Factors

Participation carries a material risk of loss. The factors below are not exhaustive and are stated plainly rather than minimised.

- ▶ **Price and liquidity.** The price of OSG may fall, including to zero. Liquidity is shallow, so large trades move the price sharply. Nothing supports or defends any price.
- ▶ **Variable rewards.** Rates fall as participation rises, fall again at each halving, and may be changed by governance within contract limits.
- ▶ **Lock-up.** LP positions are locked for 180, 365 or 540 days with no early exit, including in a falling market.
- ▶ **Impermanent loss.** Liquidity positions may return less value than was deposited, irrespective of rewards.
- ▶ **Smart-contract risk.** Contracts may contain defects; no third-party audit report is published.
- ▶ **Administrative risk.** An owner key and a single-administrator timelock control parameters, including an emergency transfer pause.
- ▶ **Concentration.** A small number of wallets hold a meaningful share of supply and could affect the market.
- ▶ **Programme risk.** The community programme may be changed or ended by governance.
- ▶ **Dependencies.** Polygon, QuickSwap, IPFS and RPC providers may fail or change.
- ▶ **Regulation.** Treatment of digital assets varies by jurisdiction and may change.

Roadmap

Delivered items are live on Polygon mainnet and can be verified at the addresses in Section 17.

STATUS	ITEM
Delivered	Token, Reward Pool and Reward Storage deployed and verified
Delivered	LP Mining in three terms (180 / 365 / 540 days)
Delivered	P2P Exchange with automatic matching
Delivered	Messenger, multilingual assistant and OSGScan
Delivered	Official domain, website and DApp at onexsmartgold.com
In progress	Transfer of remaining owner functions to the timelock
In progress	Third-party security audit
In progress	Market-data aggregator and wallet listings
Planned	Deeper liquidity and additional trading venues
Under evaluation	Deployment on a second network

No dates, deliberately. Dated commitments in a whitepaper become promises. Items are listed by status, and status is updated as work completes.

Verified Contracts

All addresses are on Polygon mainnet (chain ID 137) and verified on Polygonscan.
