OSG Token: Risk Explanation

OneX Smart Gold (OSG) · ERC-20 on Polygon PoS (chain ID 137) · Contract `0xba05176748347944CC26900c821AbFeBeBC57415`

Prepared by the OSG Team for the CoinGecko listing review · 25 October 2026 · Reference: support ticket #139225, earlier request CL0510260044

1. Purpose

The GoPlus Security scan of the OSG token shows three warnings: **mintable**, **transfer can be paused** and **owner exists**, with a possible **hidden owner** note. This document explains each flagged function: why it exists, who can call it, and the hard limits written into the verified contract code. Every statement can be checked against the verified source on Polygonscan.

2. Summary

GoPlus flag	What the code allows	Hard limits in the code
Mintable	Only the on-chain Reward Pool contract can mint the scheduled reward emission. No wallet can mint.	Max supply 23,000,000 (constant). 500 OSG per hour and 9,000 OSG per day (constants). A new minter needs governance plus a 72-hour public wait, and must be a contract.
Transfer pausable	An emergency pause of transfers for incident response.	The owner can only pause. Only governance (the public TimelockDAO) can unpause. Balances cannot be changed while paused.
Owner exists	The owner has two token powers: emergency pause, and emergency *removal* of a minter.	The owner cannot mint, unpause, add a minter, change balances, blacklist, or set any tax.
Hidden owner (if shown)	A second role called `governance`. It is public, readable on-chain, and set to the OSG TimelockDAO contract.	Every governance action is queued in the TimelockDAO and waits at least 24 hours before it can run. Changing governance itself needs a further 72-hour wait.

Checks the scan already passes: **open source (verified)** · **not a proxy / not upgradable** · **no honeypot** · **no blacklist** · **0% buy and sell tax** · **tax cannot be modified** · **balances cannot be modified by the team**.

3. Mintable: why minting exists and how it is limited

OSG has no pre-mined reward reserve. Community rewards (LP mining and staking) are minted as they are earned, on a fixed, declining schedule. This is why the token keeps a mint function.

Who can mint

- `mint()` is restricted to authorised minters **and** to addresses marked as the core reward pool. The core minter is the OSG Reward Pool contract. On mainnet the code accepts only contracts as minters, so no externally owned wallet (team or owner) can be a minter. The current count is readable via `totalMinters()`.
- Adding a minter needs governance to call `proposeMinter`, then a **72-hour** public wait (`TIMELOCK = 72 hours`), then `approveMinter`. On mainnet the new minter must be a contract. There can be at most 10 minters.

Hard limits (constants, cannot be changed)

- `MAX_SUPPLY = 23,000,000 OSG`: any mint above this reverts.
- `HARD_HOURLY_CAP = 500 OSG` and `HARD_DAILY_CAP = 9,000 OSG`: a mint above either cap reverts. The hourly-cap trip pauses and reverts in the same transaction, so the pause does not persist. The failed mint is simply rejected.

Emission schedule (Reward Pool constants)

- 5,881 OSG per day at launch (`BASE_DAILY`), halving every 3 years (`HALVING_INTERVAL`), at most 4 halvings, with a hard stop after 15 years (`EMISSION_YEARS`).
- Maximum scheduled emission over 15 years is about 12.48 million OSG. Together with the 460,000 OSG team allocation minted at launch, that stays well below the 23,000,000 cap.
- Live supply is published at `app.onexsmartgold.com/api/supply?q=total` and `?q=circulating`.

4. Transfer pausable: emergency use only

- `emergencyPause()` (owner) and `pause()` (governance) stop wallet-to-wallet transfers. They exist to stop damage if a connected contract is attacked.
- **Only governance can unpause** (`unpause()` is `onlyGov`). The owner cannot pause and unpause at will to trade around holders.
- While paused, no balance is changed, frozen per address or taken. There is no per-wallet blacklist.
- The pause blocks wallet-to-wallet transfers only. Scheduled reward minting by the Reward Pool and burning by holders are not blocked, and the mint caps still apply.
- Every pause and unpause emits a public `EmergencyAction` event.

5. Owner and governance: who holds which power

Role	Who it is	What it can do
Owner (`owner()`)	An OSG Team wallet (readable on Polygonscan)	`emergencyPause()` and `emergencyRemoveMinter()` , plus the standard OpenZeppelin ownership transfer. Both emergency powers can only *reduce* activity. Neither can create tokens or move funds.
Governance (`governance()`)	OSG TimelockDAO contract `0xE2E82A8ACdd3Af7FA74Eacb3331231A769d80D4c`	Unpause, propose and approve minters (72 h wait), change governance (2-step, 72 h wait), and rescue tokens sent to the contract by mistake (48 h wait). Each call is queued in the TimelockDAO by its admin (an OSG Team wallet) and can run only after a minimum 24-hour delay (`MIN_DELAY`), visible on-chain before it runs. A queued call expires if not run within 30 days.

The governance role is not hidden. It is a public state variable with its own events (`GovernancePropose d` , `GovernanceUpdated`), and it points to a verified, public timelock contract.

6. Why ownership is not renounced

Renouncing ownership would permanently remove the emergency pause and the ability to cut off a compromised minter. Both protect holders. We chose to keep these limited, protective powers, to disclose them fully, and to move them to stronger control rather than delete them.

> **Planned next step (not yet done):** move the owner role from a single team wallet to a multi-signature wallet (Safe), so that no single key can use the emergency powers. We will update this document and the public safety page when it is done.

7. How to verify

- Source: `polygonscan.com/address/0xba05176748347944CC26900c821AbFeBeBC57415#code` (verified).
- Read Contract: `owner()` , `governance()` , `MAX_SUPPLY()` , `HARD_HOURLY_CAP()` , `HARD_DAILY_CAP()` , `TIMELOCK()` , `totalMinters()` , `paused()` , `getStats()` .
- Public safety page with the same facts: `onexsmartgold.com/security.html` . Whitepaper: `onexsmartgold.com/whitepaper.pdf` .
- Trading: QuickSwap V2, OSG/WPOL pool `0xA15214B09a9b3E1c821B94fB97d6d3BcA8201Cd2` .
